

Alternatives for {php} In Templates

Use of the **{php}** in Smarty templates is removed and should not be used, as going forward starting in Smarty 3.1 they will no longer work. Starting in **version 6.0.0** which uses Smarty 3.1.5, you will no longer be able to use {php} Smarty tags and must use an alternate resource instead. More info can be read in the [Smarty 3.1 Release Notes](#). Here is a snippet from that specifically affecting the {php} (and related) functions:

There is absolutely no PHP allowed in templates any more. All deprecated features of Smarty 2.0 are gone. Again, use the SmartyBC class if you need any backward compatibility.

You can read more info about it on the [smarty.net documentation page for {php}](#). Technically speaking, it is possible to use a "Backwards Compatibility" Smarty class **SmartyBC** to allow using {php} but doing so will require making changes to core PHP files, which is not supported or recommended¹⁾. Below are alternatives to using {php} in your templates specific for this software.

- Use an Addon Tag instead, or use one of the other tools available to addons in the software.
- Create a smarty plugin.

¹⁾

If you really want to do that though to allow your existing {php} function until you are able to convert them, see the documentation on <http://smarty.net>.
