

WYSIWYG Settings

Admin Panel WYSIWYG Settings

Admin textareas

If you wish to use the TinyMCE while editing your templates, HTML modules, or page text please set this setting to **TinyMCE**. Otherwise set to Off to not use a WYSIWYG editor in the admin.

CSS stylesheets

Please provide the full URL of the CSS files linked to in your templates and modules. You will still need link any external stylesheets in your templates. This setting simply allows you to see the effects of your CSS in the WYSIWYG. Separate multiple CSS files with a comma.

Use GZip Compression

(For TinyMCE only) Turns on the compression feature for TinyMCE, resulting in faster page load times. This may not work with some odd server configurations, if TinyMCE does not work you might try turning compression off to see if it fixes the problem.

Affects admin & client side editors, if using the WYSIWYG editor (aka RTE Editor) for either is turned on.

IE Blank Screen Fix

This is rare, most sites should leave this setting turned **off** (un-check the box). Turning this setting on by checking the box will enable a "workaround" which will fix sites suffering from intermittent "blank screens" on pages that make use of the WYSIWYG editor. This is turned off by default as most sites do not need it, and having it turned on will slow down how fast the WYSIWYG editor can load.

Affects admin & client side editors, if using the WYSIWYG editor (aka RTE Editor) for either is turned on.

WYSIWYG Troubleshooting

When I place javascript/html code directly into the wysiwyg view of the this tool I only see code on the client side where that functionality/html should be. Why?

When you paste actual html or javascript into the wysiwyg view of the wysiwyg tool you are running the risk of the editor interpreting that as text you wish to display within the page and in this case may encode that code so that it displays directly in the browser page. If you want to paste or work

with source code click the "html" button in the wysiwyg admin tool to popup an html source view of the page and paste your javascript/html directly there. Any text entered into that view will not be encoded.

The wysiwyg tool breaks any javascript that I put into it and sometimes adds extra lines to it that I didn't insert. Why?

While in the html source view of the wysiwyg (click the "html" button in the top of the wysiwyg tool) ensure that the "word wrap" checkbox is unchecked. Then paste your code into the html view. The "word wrap" feature could automatically line inserts within long lines. This can break javascript as line feeds/breaks are important to the syntax of javascript.

The "style" I insert with my javascript does not have an effect. How do I fix?

Try inserting your <style> into the <head> of the page template. The wysiwyg has a tendency to "correct" html and may try to remove your <style> tags as they are incorrectly placed if in the <body>.

My html is different when I come back to it in another editing session. Why?

The wysiwyg editor tries to "correct" html you insert into it. Make sure the html you enter is correct and doesn't confuse the editor. If you leave an open <table>, <tr>, <td> or <div> tag you may not like the results and will have to deal with how the editor tries to "correct" your mistakes.
