

Alternatives for {php} In Templates

Use of the **{php}** in Smarty templates is removed and should not be used, as going forward starting in Smarty 3.1 they will no longer work. Starting in **version 6.0.0** which uses Smarty 3.1.5, you will no longer be able to use {php} Smarty tags and must use an alternate resource instead. More info can be read in the [Smarty 3.1 Release Notes](#). Here is a snippet from that specifically affecting the {php} (and related) functions:

```
There is absolutely no PHP allowed in templates any more. All deprecated features of Smarty 2.0 are gone. Again, use the SmartyBC class if you need any backward compatibility.
```

You can read more info about it on the [smarty.net documentation page for {php}](#). Technically speaking, it is possible to use a "Backwards Compatibility" Smarty class **SmartyBC** to allow using {php} but doing so will require making changes to core PHP files, which is not supported or recommended¹⁾. Below are alternatives to using {php} in your templates specific for this software.

- Use an Addon Tag instead, or use one of the other tools available to addons in the software.
- Create a smarty plugin.

¹⁾

If you really want to do that though to allow your existing {php} function until you are able to convert them, see the documentation on <http://smarty.net>.
